search:
GMM-MI inner loss

selection:
held-out gmm-mi

$f, g_1 \circ f, g_2 \circ f$
same MI

one invariance class: $\text{MI}(g(f); \mu) = \text{MI}(f; \mu)$

for ANY bijection g — rewarded for functional dependence,
never for matching the encoder's calibration

**answers are
equivalence classes**

→ canonical selection
by semantic recurrence (§4)

**readable physics =
the class invariant**

→ the ratio field
 $(\partial f / \partial \tau) / (\partial f / \partial \ln A_s)$ (§5)
